

In my vision of a computing utopia, disruptive technology advancements should transform society by elevating and reaching wider segments of society, enabling more pluralistic values and voices while breaking barriers to access. Throughout my graduate journey, I served on a multitude of committees in various volunteer-based roles to pursue this objective.

My own research journey began as a [STRONG scholar](#) at Oberlin College – a program introducing recently admitted students to research opportunities on campus the summer before their first year. Among this cohort of highly diverse, supportive and engaged intellectuals, I learned critical research skills of collaborative brainstorming, effective paper reading and most importantly, the idea of a growth mindset. Later I learned to continuously learn and apply diverse, critical and intersectional perspectives towards research. Presenting to a multitude of audiences not only enriches our understanding of social computing ideas, it also critiques and improves my coherence discussing them. I am committed to imparting such abilities to grow better intuition, open-mindedness and critical thinking to future researchers.

Through service commitments, I co-organized (1) large-scale speed-dating sessions with the [Dean's PhD Advisory Working Group for Undergraduate Research Engagement](#) to connect budding undergraduate researchers with potential mentors (2) facilitated matchings connecting PhD applicants across institutions with existing doctoral students as a part of CMU's [graduate application support program](#) and (3) cross-department lunches as a part of [Women @ SCS](#) initiative to connect graduate and postdoctoral gender minorities in computing.

As an active member of my research community, I currently serve as an associate chair for the *Interactions Beyond the Individual* subcommittee of CHI (ACM Conference on Human Factors in Computing Systems), where I was also an assistant to the subcommittee chairs three years back. Last year, I served both as a member of (1) the tenure-track search committee for my department (Software and Societal Systems) as well as a student representative on the (2) committee for student teaching awards at the School of Computer Science. As a reviewer, I served on the panel for REU admissions in my own department (2021-2025) as well as at the Human Computer Interaction Institute (2023). With the exception of 2023 (where I served as a subcommittee chair assistant), I reviewed papers yearly for CHI since 2020, and for CHIWORK since 2023. In even earlier stages of my graduate career, I was a student volunteer at the ACM conferences of CHI, DIS and UIST in 2023.

It was not until after my graduation that I realized how incredibly fortunate I was to be a part of an immensely supportive computing community at CMU. With its regular and ongoing forces that uplift us, we are able to push forward despite how the marginality of our identities continue to strike at us. Incredibly, many of these efforts and endeavors to empower computing students (and communities impacted by technologies) remain ongoing, despite surrounding sociopolitical and organizational forces. Amidst an ever-changing digital landscape, I am committed to finding novel ways of propelling next generations of vulnerable students and workers towards more liberated and thriving careers in technology.
